minichromosome maintenance protein mcm7p [imported] - fission yeast (Schizosaccharomyces N;Alternate names: cell division control protein 47 homolog
C;Species: Schizosaccharomyces pombe
C;Date: 03-Dec-1999 #sequence_revision 03-Dec-1999 #text_change 28-Jul-2000
C;Accession: T39991; T45282
R;Lyne, M.; Rajandream, M.A.; Barrell, B.G.; Whithead, S.; Chillingworth, T.; Churcher, Submitted to the EMBL Data Library, July 1998
A;Reference number: Z21897
A;Accession: T39991
A;Scatus: preliminary; translated from GB/EMBL/DDBJ
A;Residues: 1-760 <a href="https://documer.com/d/">LYNA</a>
A;Residues: 1-760 <a hr
A;Cross-references: GB:BA000007; PIDN:BAB37764.1; PID:g13363815; GSPDB:GN00154
A;Experimental source: strain O157:H7, substrain RIMD 0509952
C;Genetics:
A;Gene: EC84341
C;Superfamily: 3-oxoacyl-[acyl-carrier-protein] synthase I; 3-oxoacyl-[acyl-carrier-prot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2A10 has a per minute Kcat of 0.01. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW39824-26 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 12H1, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody was identified using TSA2, and has a per minute Kcat of 0.16. The antibodies particularly for the treatment of an overdose. They are used particularly for the treatment of an overdose. They are also used for achieved).

                                                                                                                                                                                                                                                                                                                                                                                     ő
                                                                               AAW39818-20 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 6Al2, which is able to degrade cocarine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 6Al2 antibody was identified using TSAl, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 6Al2 has a per minute Kcat of 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW39821-23 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 2A10, which is able to degrade cocaine. antibody C11 (see also AAY32262). The invention provides altered antibody C11 (see also AAY32262). The invention provides altered antibody C11 (see also AAY32262). The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of C11 light and heavy chain CDRs (see AAY3224-59) to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies of type II molecule expressed on haematopoietic cells. The antibodies of type II molecule expressed on haematopoietic cells. The antibodies of type II molecule expressed on haematopoietic cells. The antibodies of type II molecule expressed on haematopoietic cells. The antibodies of diabetes, vieitis, dermatitis, psoriasis, untitaring achemia, antibule CD23 formation for treatment of arthritis, clohn's disease, Sjogren's syndrome, allergies, allergic achima, intrinsic asthma, southe asthmatic exacerbation, rhinitis, collitis, crohn's disease, Sjogren's syndrome, allergies, allergic achima, intrinsic asthma, acute asthmatic exacerbation, rhinitis, coming interning bronchitis) or plabetes (particularly chronic Dronchitis) or plabetes (particularly thornic Dronchitis) or plabetes (particularly the bronch Dronchitis) or plabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and determining the binding agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -

```

The patent discloses a humanised antibody or its antigen-binding for fragment, having binding specificity for CC-chemokine receptor 2 (CCR2), comprising an antigen binding region of non-human origin and at least a portion of an immunospolubulin of human origin. The chumanised antibodies are useful for inhibiting the interaction of a cell expressing CCR2. They are useful for inhibiting or treating CCC leukocyte trafficking, for treating CCR2-mediated disorders such as inflammatory disorder, autoimmune disorders such as rheumatory disorder, autoimmune disorders such as rheumatory disorder, autoimmune disorders such as rheumatory disorder, autoimmune disorders such as rheurists and multiple socierosis, atherogenesis and atherosocierosis, anthibiting restenosis. They are useful in therapy or disorder and in the manufacture of a medicament for treating CCR2 mediated disorder and in the manufacture of a medicament for treating allersy, anaphylaxis, an anignanary, chronic and acute inflammation, histamine and IgE-mediated allergic reaction, shock, stenosis, allograft rejection, including angioplasty and/or stent placement in a mammal. The restending angioplasty and/or stent placement in a mammal. The preferably associated with vascular intervention, including angioplasty and/or stent placement in a mammal, and inhibiting nearowing of the lumanised antibodies are also useful for inhibiting nearowing of the a vessel in a mammal, and inhibiting nearowing of the region, 167/24.

The present sequence represents the light chain of a catalytic antibody which is capable of degrading cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Variable domain; lambda light chain; catalytic antibody; degradation; cocaine, cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.

A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in subject, and are used particularly for the treatment of an overdose. They are also used for treating, addiction (by reducing the in vivo concentration that can be

                                                                                                                                                                                                                                                                                     AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 6Al2 antibody (AAW39807 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 6Al2 has a per minute Kcat of 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can

AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody (AAW39808 represents the heavy chain) was identified using TSA2, and has a per minute Kcat of 0.016. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;

                   AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occanie. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Stralytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The ZALO antibody (AAW39809 represents the heavy chain) was identified using TSAL, which is an immunogenic conjugate of a phosphate monoseter transition state analogue. Antibody ZALO has a per minute Kcat of 0.01. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can

This sequence represents the light chain variable region (VL) of humanised anti-CD23 (FCERII) monoclonal antibody C11, composed of a human framework (HSIGKVII) and the light chain complementarity determining regions (see AAV3254-56) of murine antibody C11. The altered antibodies, work as chain complementarity the invention provides attered antibodies, which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions to render them comparise of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, cups exprhementarity dermaticis, pryne II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Sjogren's syndrome, allergies allergies asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, eccema, graft-versus-host disease, COPD, insulitis, bronchitis (particularly chronic bronchitis) or diabetes (particularly chronic bronchitis) or diabetes (particularly the main allergies allergies for studying interactions between CD23 and various ligands and

AAM39815-17 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 3B9, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 3B9 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Variable domain; lambda light chain; catalytic antibody; degradation; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Variable domain of the Kappa light chain of catalytic antibody 3B9.
                                                                                                                                                                                                                                                                                                     New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           90.3%; Score 28; DB 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the light chain variable region (VL) of murine anti-CD23 (FCERII) monoclonal antibody Cll. The invention provides altered antibodies, such as chimerioc rhumanised antibodies (see AAY22262 and AAY32265), which comprise sufficient of the amino acid sequences of the Cll light and heavy chain complementarity determining regions (see AAY32254-59) to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble cops formation in human therapy, for the treatment of arthritis, cops formation in human therapy, for the treatment of arthritis, classes, viscitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Solgren's syndrome, allergic asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, cromn's disease, Solgren's syndrome, allergic asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, cromn's disease, Copi, insulitis, bronchitis (particularly chronic bronchitis) or diabetes (particularly type I diabetes), and B-cell malignanches (claimed). They are also useful convenient and various ligands and acceptance of the property of the principal particularly changes and particularly are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Variable domain; lambda light chain; Catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                           AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transitions state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl occaine. The 3B9 antibody (AAW39806 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.

The present sequence represents the single chain FV region of the monoclonal catalytic antibody 3B9, which is capable of degrading cocaine. A series of cocaine transition state analogues (TSAB) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Sequence 281, Application US/09712363

Patent No. US2020164588A1

Sequence 281, Application US/09712363

Patent No. US2020164588A1

APPLICANT: Eleenberg, David

APPLICANT: Marcotte, Edward M.

ITILE OF INVENTION: DETERMING THE FUNCTIONS AND

ITILE OF INVENTION: INTERACTIONS OF PROTEINS BY COMPARATIVE ANALYSIS

ITILE REFERENCE: 07419-032001

CURRENT APPLICATION NUMBER: US/09/712,363

CURRENT APPLICATION NUMBER: 06/179,531

PRIOR FILING DATE: 2000-01-01

PRIOR FILING DATE: 2000-02-01

PRIOR FILING DATE: 2000-02-01

PRIOR PELING DATE: 1999-01-29

PRIOR APPLICATION NUMBER: 60/114,093

PRIOR PELING DATE: 1999-02-01

PRIOR PELING DATE: 1999-05-14

PRIOR PELING DATE: 1999-05-14

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US-00-76-877-1708

Sequence 1708, Application US/09764877

Sequence 1708, Application US/09764877

Patent No. US20020147140A1

GENERAL INFORMATION:

TITLE OF INVENTION: Nucleic Acids, Proteins, and Antibodies

TITLE OF INVENTION: Nucleic Acids, Proteins, and Antibodies

TITLE OF INVENTION: Nucleic Acids, Proteins, and Antibodies

CURRENT APPLICATION UNBER: US/09/764,877

CURRENT FILING DATE: 2001-01-17

Prior application data removed - refer to PALM or file wrapper

NUMBER OF SEQ ID NOS: 4031

SOFTWARE: PatentIN Ver. 2.0

SEQ ID NO 1708

TENGTON 1708
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  OTHER INFORMATION: MAP TO AC024196.2

```
A) Introns: 17/1

C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (ka

hain disulfidab bonds. In some cases, such as IgA and IgM, the subunits associate into 1

C;Superfamily: immunoglobulin V region; immunoglobulin homology

C;Keywords: heterotetramer

XX MALAT SUBJUINOL-CYTOCHROME C REDUCTASE
XX TOWPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A
XX STREPFFATORY THAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
XX COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX)
XX COMPLEX TWO HEME GROUPS (8562 AND 8566) WHICH ARE NOT COVALENTLY
XX SUBJUINT: THE MAIN SUBJUINS OF COMPLEX B-C1 ARE: CYTOCHROME B,
XX CYTOCHROME C1 AND THE RIESKE PROTEIN.
XX SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             COUPLED TO ATP SYNTHESIS.
-!- COFACTOR: TWO HEME GROUPS (BS62 AND BS66) WHICH ARE NOT COVALENTLY BOUND TO THE PROTEIN.
-!- SUBGNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIBSKE PROTEIN.
-!- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

Cloning and developmental expression analysis of the murine homolog

The spinocerebellar ataxia type 1 gene (Scal).";

C. -1 TISSUE SPECIFICITY: WIDELY EXPRESSED. IN BRAIN, THE PATTERN OF

DISTRIBUTION IS LIMITED TO NEURONS POPULATIONS.

C. -1 DEVELOPMENTAL STAGE: TRANSIENT EXPRESSION BURST IN PURKINJE CELLS

AS THE CEREBELLAR CORTEX BECOMES FUNCTIONAL (POSTNATAL DAY 14),

AND IN MESSENCHYMAL CELLS OF THE DEVELOPING INTERVERTEBRAL DISCS OF

THE SPINAL COLUMN:

C. -1 POLYMORPHISM: THE MURINE POLY-GLN REGION IS VERY LIMITED IN

C. -1 POLYMORPHISM: THE HUMAN SCAI AND IS NOT POLYMORPHIC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. Nature 392:353-358(1998).
-!- CATALYTIC ACTIVITY: ATP + glycine + tRNA(Gly) = AMP + diphosphate
                                                                                   + glycyl-trna(gly).
-!- SUBINIT: TETRAMER OF TWO ALPHA AND TWO BETA CHAINS
-(BY SIMILARITY).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: BELONGS TO CLASS-II AMINOACYL-TRNA SYNTHETASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           EMBL; AE000775; AAC07870.1; -.

SCAI IS AN AUTOSOMAL DOMINANT NEUDODEGENERATIVED INSORDER
CHARACTERIZED BY PROCRESSIVE NEURONAL LOSS IN THE CEREBELLUM,
BRAIN STEM AND SPINOCEREBELLAR TRACTS. CLINICAL FEATURES ARE
CREBELLAR ATAXAL, DYSARTHAIA, OPHTALMOPARESIS, MISCLE MASTING AND
NEUROPATHY. ONSET OF THE DISEASE USUBLLY OCCURS IN THE THIRD OR
POURTH DECADE OF LIFE AND DEATH OCCURS TEN TO TWENTY YEARS LATER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Banfi S., Servadio A., Chung M.-Y., Kwiatkowski T.J.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ALTERNATUR SPLICING.
-!- TISSUB SPECIFICITY: MIDELY EXPRESSED THROUGHOUT THE BODY.
-!- POLYMORPHISM: THE POLY-GLN REGION OF SCA1 IS HIGHLY POLYMORPHIC (9 TO 39 REPRATS) IN THE NORMAL POPULATION AND IS EXPANDED TO ABOUT 40-81 REPEATS IN SCA1 PATIENTS. LONGER EXPANSIONS RESULT IN BARLIER ONSET AND MORE SEVERE CLINICAL MANIFESTATIONS OF THE DISEASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DISEASE: DEFECTS IN SCA1 ARE THE CAUSE OF SPINOCEREBELLAR ATAXIA

Jr., Maines M.D.;

T. Site-directed mutagenesis of cysteine residues in biliverdin
"Site-directed mutagenesis of cysteine residues in biliverdin
reductase. Roles in substrate and cofactor binding.";

Eur. J. Biochem. 222.597-603(1994).

-! FUNCTION: CONVERTS BILIVERDIN TO BILIRUBIN; DISPLAYS TWO DISTINCT
PH OPTIMA USING A DIFFERENT COPACTOR AT EACH PH: NADH AT THE LOWER
PH 6.7-6.9 RANGE AND NADH AT PH 8.5-8.7. NADPH, HOWEVER, IS THE
PROBABLE COPACTOR IN BIOLOGICAL SYSTEMS.

-!- CATALYTIC ACTIVITY: Bilirubin + NAD(P) (+) = biliverdin + NAD(P) H.

-!- PATHWAY: FINAL STRP IN HEME METABOLISM.

-!- SUBUNIT: MONOMER (BY SIMILARITY).

-!- SUBUNITY: TO B.COLI YHHX.

Smith M.F., Patton J.L.,

"Phylogenetic relationships and the radiation of sigmodontine rodents
in South America: Bvidence from cytochrome b.";

J. Mammal. Evol. 6:89-128(1999).

- !- FUNCTION: COMPUENT II OR CYTOCHROME B.-CI COMPLEX), WHICH IS A

RESPIRATORY CHAIN THAT GENERALES AN ELECTROCHEMICAL POTENTIAL

COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

- COFACTOR: TWO HEME GROUPS (BSCS AND BSCS) WHICH ARE NOT COVALENTLY

BOUND TO THE PROTEIN (BY SIMILARITY).

- SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,

CYTOCHROME CI AND THE RIESKE PROTEIN (BY SIMILARITY).

- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

Subjective phylogeny of ground squirrels and prairie dogs.";

Submitted (JUN-1999) to the EMBL/GenBank/DDBJ databases.

COMPLEX (COMPLEX IO TOF THE UBIQUINOL-CYTOCHROME C REDUCTASE

- FUNCTION: COMPLEX II OR CYTOCHROME B.-CI COMPLEX). WHICH IS A

RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL

COMPLED TO APP SYNTHESIS (BY SIMILARIY).

C-I- COPACTOR: TWO HEME GROUPS (BS62 AWICH ARE NOT COVALENTLY)

C-I- COPACTOR: TWO HEME GROUPS (BS62 AWICH ARE NOT COVALENTLY)

C-I- SUBMINIT: HER ALIN SUBUNITS OF COMPLEX B-CI ARE: CYTOCHROME B,

C-I- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

C-I- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

C-I- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

"A molecular phylogeny of ground squirrels and prairie dogs.";
Submitted (JUN-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS (BY SIMILARITY).
-!- COPPACTOR: TWO HEMB GROUPS (BSE2 AND BSE6) WHICH ARE NOT COVALENTLY
--- COPPACTOR: TWO HEMB GROUPS (BSE2 AND BSE6) WHICH ARE NOT COVALENTLY

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Submitted (JUN-1999) to the EMBL/Genbank/DDBJ databases.

LE Submitted (JUN-1999) to the EMBL/Genbank/DDBJ databases.

-I-FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE.

COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

-I-COPACTOR: TWO HEME GROUPS (BS62 AND B566) WHICH ARE NOT COVALENTLY BOUND TO THE PROTEIN (BY SIMILARITY).

-I-SUBMLIT: THE MAIN SUBMITS OF COMPLEX B-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIESER PROTEIN (BY SIMILARITY).

-I-SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

Subilited (JUL-1999) to the EMBL/GenBank/DDBJ databases.

L Submitted (JUL-1999) to the EMBL/GenBank/DDBJ databases.

COMPLEX (COMPLEX II OR CYTOCHROME C REDUCTASE COMPLEX (COMPLEX II OR CYTOCHROME B-C.1 COMPLEX), WHICH IS A COMPLEX OF SYNTHERSIS (BY SIMILARITY).

COMPLEX TO ATE SYNTHERSIS (BY SIMILARITY).

COUPLED TO ATE SYNTHERSIS (BY SIMILARITY).

COUPLED TO ATE SYNTHERSIS (BY SIMILARITY).

COPPACTOR: TWO HEME GROUPS (BS-52 AND BS-66) WHICH ARE NOT COVALENTLY CC. -1 SUBUNIT: THE MAIN SUBUNITS OF COMPLEX BY SIMILARITY).

COPPACTOR: THE PROTEIN (BY SIMILARITY).

COPPACTOR: THE RIBERE PROTEIN (BY SIMILARITY).

COPPACTOR: THE RIBERE PROTEIN (BY SIMILARITY).

COPPACTOR: THE RIBERE PROTEIN (BY SIMILARITY).

COPPACTOR: THE PROTEIN (BY SIMILARITY).
